# What is a TABLE?

- Table – a 2D structure with rows and columns (think of a spreadsheet?)
- Each Row is a record (tuple) with multiple attributes (fields; column names)

TABLE 3.1

## CHARACTERISTICS OF A RELATIONAL TABLE

1	A table is perceived as a two-dimensional structure composed of rows and columns.
2	Each table row ( <b>tuple</b> ) represents a single entity occurrence within the entity set.
3	Each table column represents an attribute, and each column has a distinct name.
4	Each intersection of a row and column represents a single data value.
5	All values in a column must conform to the same data format.
6	Each column has a specific range of values known as the <b>attribute domain</b> .
7	The order of the rows and columns is immaterial to the DBMS.
8	Each table must have an attribute or combination of attributes that uniquely identifies each row.

*If you compare to OO Class:*  
A table is an **array** of Students, with **data fields** of stu\_num, stu\_lname, etc.

# Table Attributes (Fields)

- Each data field has a:
  - Distinct name (STU\_NUM, STU\_LNAME, etc)
  - Data type (just like strongly typed languages, ex: C, Java)
  - Represents a single attribute
- Data Type Options: Numeric, Character (String), Date/Time, Logical (Boolean)
- Valid Data Options: Data fields can have a DOMAIN of possible options
  - GPA can be limited between 0.0 and 4.0 inclusive [0.0, 4.0]
- Order is not important to the user (can be determined later)
- Tables have a PRIMARY KEY, a unique data field used for indexing and protecting from data redundancy (STU\_NUM)

Table name: STUDENT

Database name: Ch03\_TinyCollege

STU_NUM	STU_LNAME	STU_FNAME	STU_INIT	STU_DOB	STU_HRS	STU_CLASS	STU_GPA	STU_TRANSFER	DEPT_CODE	STU_PHONE	PROF_NUM

## RE 3.1 STUDENT TABLE ATTRIBUTE VALUES

Table name: STUDENT

Database name: Ch03\_TinyCollege

STU_NUM	STU_LNAME	STU_FNAME	STU_INIT	STU_DOB	STU_HRS	STU_CLASS	STU_GPA	STU_TRANSFER	DEPT_CODE	STU_PHONE	PROF_NUM
321452	Bowser	William	C	12-Feb-1985	42	So	2.84	No	BIOL	2134	205
324257	Smithson	Anne	K	15-Nov-1991	81	Jr	3.27	Yes	CIS	2256	222
324258	Brewer	Juliette		23-Aug-1979	36	So	2.26	Yes	ACCT	2256	228
324269	Oblonski	Walter	H	16-Sep-1986	66	Jr	3.09	No	CIS	2114	222
324273	Smith	John	D	30-Dec-1968	102	Sr	2.11	Yes	ENGL	2231	199
324274	Katinga	Raphael	P	21-Oct-1989	114	Sr	3.15	No	ACCT	2267	228
324291	Robertson	Gerald	T	08-Apr-1983	120	Sr	3.87	No	EDU	2267	311
324299	Smith	John	B	30-Nov-1996	15	Fr	2.92	No	ACCT	2315	230

STU_NUM	= Student number
STU_LNAME	= Student last name
STU_FNAME	= Student first name
STU_INIT	= Student middle initial
STU_DOB	= Student date of birth
STU_HRS	= Credit hours earned
STU_CLASS	= Student classification
STU_GPA	= Grade point average
STU_TRANSFER	= Student transferred from another institution
DEPT_CODE	= Department code
STU_PHONE	= 4-digit campus phone extension
PROF_NUM	= Number of the professor who is the student's advisor

# Keys

- Determination – Knowing the value of 1 attribute → determine other attributes.
  - If I know my speed and time, I can DETERMINE my distance ( $S * T = D$ )
  - In Databases, based on RELATIONSHIPS – Functional Dependence
- Determinate – value that determines other values (dependent)
- Primary Key – Single (usually) data field that is unique to the table (Cannot be null!)
- Composite Keys – Multiple values (key attribute) combine to determine other attribute(s)
- Super Key – Key that can uniquely identify any row (often Primary Key)
- Candidate Key – Minimal Super Key, no unnecessary attributes
  - Used as possible options to determine a primary key

Key	Type
STU_NUM	Primary Key, Candidate Key, Super Key
STU_NUM, STU_LNAME	Composite Key, Super Key
STU_LNAME, STU_FNAME, STU_INIT, STU_PHONE	Composite Key
STU_SSN	Candidate Key, Super Key

## Other Keys...

**Quick note on NULL:**  
Null is the absence of data, not a 0 or a space. Can be a problem with functionality (Count, Average, etc)

- Foreign Keys – Primary key from one table used as a data field in another.
  - Referential Integrity – Every reference is either valid or NULL
- Secondary Keys
  - Not primary key, but can be used to look up values (Last name, phone number, email?)
  - Could return multiple values, but might be useful anyway

Table name: PRODUCT  
Primary key: PROD\_CODE  
Foreign key: VEND\_CODE

Database name: Ch03\_SaleCo

PROD_CODE	PROD_DESCRIPTION	PROD_PRICE	PROD_ON_HAND	VEND_CODE
001278-AB	Claw hammer	12.95	23	232
123-21UUY	Housette chain saw, 16-in. bar	189.99	4	235

234	Arthur Jones	615	123-3324
235	Henry Ortozo	615	899-3425

# Integrity Rules

**Entity Integrity –**  
Primary Keys will be  
unique and NOT null

**Referential Integrity –**  
Foreign Keys will either  
be null or a valid  
primary key in other  
table

INTEGRITY RULES	
ENTITY INTEGRITY	DESCRIPTION
Requirement	All primary key entries are unique, and no part of a primary key may be null.
Purpose	Each row will have a unique identity, and foreign key values can properly reference primary key values.
Example	No invoice can have a duplicate number, nor can it be null; in short, all invoices are uniquely identified by their invoice number.
REFERENTIAL INTEGRITY	DESCRIPTION
Requirement	A foreign key may have either a null entry, as long as it is not a part of its table's primary key, or an entry that matches the primary key value in a table to which it is related (every non-null foreign key value <i>must</i> reference an <i>existing</i> primary key value).
Purpose	It is possible for an attribute <i>not</i> to have a corresponding value, but it will be impossible to have an invalid entry; the enforcement of the referential integrity rule makes it impossible to delete a row in one table whose primary key has mandatory matching foreign key values in another table.
Example	A customer might not yet have an assigned sales representative (number), but it will be impossible to have an invalid sales representative (number).

# Relational Algebra

- RelVar – Relational Variable –
  - Container that holds our relation (reference vs. actual data)
  - Can be thought of as a reference to a table or a record-set of data
- Relational Set Operators
  - Closure – Use of relational algebra operators to produce new relations

Select	• Restrict – Yields all values from 1 table that meet a specific criteria
Project	• Returns all values for selected attributes from 1 table
Union	• Combines all rows from 2 tables, excluding duplicate rows. Tables must have same attributes!
Intersect	• Yields ONLY rows that exists in both tables (2 tables). Tables must have same attributes.
Difference	• Yields All rows in one table (A) that are NOT in another table (B)
Product	• Yields all possible pairs of rows from two tables (Cartesian Product)
Join	• Allows information combined from 2 or more tables (VERY, VERY IMPORTANT!)
Divide	• Divide two tables: dividend must be 2 columns, divisor must be 1 column... return any records in the second column of the first table in which the first column matches all values in the divisor

# Joining 2 (or more) tables

*the real power behind relational databases*

- **Natural Join** – Product → Select → Project :
  - Gets all rows from both tables where the 'on' criteria are equal
  - "SELECT \* from A JOIN B on A.stu\_num = B.stu\_num" : Get all fields from both tables where the student number is equal
- **EquiJoin** – Link tables with an equality condition
- **ThetaJoin** – Link tables with a inequality comparator (>, <, <=, >=)
- **Outer Join** (Left or Right)
  - Join that matches ALL values from one table, and matching values from the other table (depending on which side of the equation)
  - Select \* from A **LEFT JOIN** B on A.stu\_num = B.stu\_num : Get all fields from A, and only those from B where the students numbers are the same.
  - Select \* from A **RIGHT JOIN** B on A.stu\_num = B.stu\_num: Get all fields from B and only those from A where the student numbers are the same
  - Non-matching fields will return as null

# 1:M Relationships in the Relational Database

- 1:M – Easiest to implement and maintain (try to make this!)
  - 1: Primary key in this table – Painter\_Num (Painter)
  - M: Foreign key (Painter\_Num) in this table (Painting)

Table name: PAINTER

Primary key: PAINTER\_NUM

Foreign key: none

Database name: Ch03\_Museum

PAINTER_NUM	PAINTER_LNAME	PAINTER_FNAME	PAINTER_INITIAL
123	Ross	Georgette	P
126	Iero	Julio	O

Table name: PAINTING

Primary key: PAINTING\_NUM

Foreign key: PAINTER\_NUM

PAINTING_NUM	PAINTING_TITLE	PAINTER_NUM

# 1:1 Relationships

- Should be rare (try to avoid)
- Should be optional (otherwise, you'd have the data in the same table?)
- Add primary key from first table as the foreign key in the second table.
- Add the primary key from the second table as the foreign key in the first table.

Table name: PROFESSOR

Primary key: EMP\_NUM

Foreign key: DEPT\_CODE

Database name: Ch03\_TinyCollege

# M:N Relationships

- M:N – Can't be done directly... must be implemented into 1:M / N:1 relationships
- Create middle table (linking table) to hold middle relationship

Table name: STUDENT  
Primary key: STU\_NUM  
Foreign key: none

STU_NUM	STU_LNAME	CLASS_CODE
321452	Bowser	10014
321452	Bowser	10018
321452	Bowser	10021
324257	Smithson	10014
324257	Smithson	10018
324257	Smithson	10021

Table name: CLASS  
Primary key: CLASS\_CODE  
Foreign key: STU\_NUM

CLASS_CODE	STU_NUM	CRS_CODE	CLASS_SECTION	CLASS_TIME	CLASS_ROOM	PROF_NUM
10014	321452	ACCT-211	3	TTh 2:30-3:45 p.m.	BUS252	342
10014	324257	ACCT-211	3	TTh 2:30-3:45 p.m.	BUS252	342
10018	321452	CIS-220	2	MWF 9:00-9:50 a.m.	HLR211	114
10018	324257	CIS-220	2	MWF 9:00-9:50 a.m.	HLR211	114
10021	321452	GM-261	1	MWF 8:00-8:50 a.m.	HLR200	114
10021	324257	GM-261	1	MWF 8:00-8:50 a.m.	HLR200	114

- Now you have two 1:M relationships
  - Student : Enroll (1:M)
  - Class : Enroll (1:N)

Table name: STUDENT  
Primary key: STU\_NUM  
Foreign key: none

STU_NUM	STU_LNAME
321452	Bowser
324257	Smithson

Database name: Ch03\_CollegeTry2

Table name: ENROLL  
Primary key: CLASS\_CODE + STU\_NUM  
Foreign key: CLASS\_CODE, STU\_NUM

CLASS_CODE	STU_NUM	ENROLL_GRADE
10014	321452	C
10014	324257	B
10018	321452	A
10018	324257	B
10021	321452	C
10021	324257	C

Table name: CLASS  
Primary key: CLASS\_CODE  
Foreign key: CRS\_CODE

CLASS_CODE	CRS_CODE	CLASS_SECTION	CLASS_TIME	CLASS_ROOM	PROF_NUM
10014	ACCT-211	3	TTh 2:30-3:45 p.m.	BUS252	342
10018	CIS-220	2	MWF 9:00-9:50 a.m.	HLR211	114
10021	GM-261	1	MWF 8:00-8:50 a.m.	HLR200	114

# Data Redundancy - Normalization

- Use of proper foreign keys minimizes redundancy.
- Real test: Does the elimination of an attribute eliminate information
  - Can I get the information through other means?
  - Is the cost of the lookup worth the savings in data redundancy?
  - How is the data used in normal use?

# Indexes

- An ordered array of key values and ROW ID values (pointers) to help speed up lookups.
- Helps find information quickly.
- Index key (ex: primary key, but not required) – Index reference point
- Primary keys and foreign keys are often indexed, since you often join on those fields.
- Unique Index – Only 1 row associated with it.
- Indexes are assigned to a single table, but a single table can have many indexes

# Codd's Relational Database Rules

TABLE 13.8

## DR. CODD'S 12 RELATIONAL DATABASE RULES

RULE	RULE NAME	DESCRIPTION
1	Information	All information in a relational database must be logically represented as column values in rows within tables.
2	Guaranteed access	Every value in a table is guaranteed to be accessible through a combination of table name, primary key value, and column name.
3	Systematic treatment of nulls	Nulls must be represented and treated in a systematic way, independent of data type.
4	Dynamic online catalog based on the relational model	The metadata must be stored and managed as ordinary data—that is, in tables within the database; such data must be available to authorized users using the standard database relational language.
5	Comprehensive data sublanguage	The relational database may support many languages; however, it must support one well-defined, declarative language as well as data definition, view definition, data manipulation (interactive and by program), integrity constraints, authorization, and transaction management (begin, commit, and rollback).
6	View updating	Any view that is theoretically updatable must be updatable through the system.
7	High-level insert, update, and delete	The database must support set-level inserts, updates, and deletes.
8	Physical data independence	Application programs and ad hoc facilities are logically unaffected when physical access methods or storage structures are changed.
9	Logical data independence	Application programs and ad hoc facilities are logically unaffected when changes are made to the table structures that preserve the original table values (changing order of columns or inserting columns).
10	Integrity independence	All relational integrity constraints must be definable in the relational language and stored in the system catalog, not at the application level.
11	Distribution independence	The end users and application programs are unaware of and unaffected by the data location (distributed vs. local databases).
12	Nonsubversion	If the system supports low-level access to the data, users must not be allowed to bypass the integrity rules of the database.
13	Rule zero	All preceding rules are based on the notion that to be considered relational, a database must use its relational facilities exclusively for management.

# Summary

- Tables are the basic building blocks of relational databases
- Keys are central to relational tables (including a primary key)
- Tables are linked through common attributes (and foreign keys)
- Primary Operations: Select, Join
  - Secondary Operations: Project, Intersect, Union, Difference, Product, Divide
- Data Dictionary/System Catalog holds metadata about the database
- Good design starts by understanding relationships (1:1, 1:M, M:N)
