Dr.sarah Mohamed

HTML5 Tags AND HTML5 Semantics

Introduction to HTML5

- ▶ The fifth and current version of HTML.
- ▶ In 2008, the first HTML5 public draft was released.
- ▶ Has improved the markup available for documents

HTML 5 features

- ▶ Introduced new multimedia features which supports audio and video controls by using `<audio>` and `<video>` tags.
- ▶ There are new graphics elements including vector graphics and tags.
- ▶ Enrich semantic content by including `<header>` `<footer>`, `<article>`, `<section>` and `<figure>` are added.
- ▶ Web storage facility which provides web application methods to store data on web browser.
- ▶ Uses SQL database to store data offline
- ▶ Allows to draw various shapes like triangle, rectangle, circle, etc.
- ▶ Capable of handling incorrect syntax.
- ▶ Easy character encoding i.e. `<meta charset="UTF-8">`

<article> Tag

- ▶ Acts as a container for any section of a page that could stand alone and potentially be syndicated.
- ▶ This could be an individual article or blog entry, a comment or forum post, or any other independent piece of content.
- ▶ Used to represent an article. More specifically, the content within the <article> tag is independent from the other content of the site.
- ▶ The <article> elements can even be nested inside each other. The <article> element can include:
 - blog entry
 - forum post
 - news
 - comment
- ▶

Articles about flowers

Roses

Rose – the queen of flowers - is the object of worship and ardent love. Since time immemorial, the rose has been the object of worship and admiration.

Lilies

Lily - an amazing beauty flower, one of the most ancient among a variety of beautiful plants.

<header> Tag

- ▶ A container for introductory content or a set of navigational links.
- ▶ A <header> element may contain:
 - one or more heading elements (<h1> - <h6>)
 - logo or icon
 - authorship information
- ▶ You can have several <header> elements in one document.
- ▶ A <header> tag cannot be placed within a <footer>, <address> or another <header> element.

Welcome to My Website

- [Home](#)
- [About](#)
- [Contact](#)

```
<!DOCTYPE html>
<html>
  <head>
    <title>Title of the document</title>
  </head>
  <body>
    <header>
      <h1>Welcome to My Website</h1>
      <nav>
        <ul>
          <li><a href="#home">Home</a></li>
          <li><a href="#about">About</a></li>
          <li><a href="#contact">Contact</a></li>
        </ul>
      </nav>
    </header>
    </body>
  </html>
```

<footer> Tag

- ▶ Defines a footer for a document or section.
- ▶ Should contain information about its containing element.
- ▶ A <footer> element may contain:
 - Copyright information
 - contact information
 - back to top links
 - authorship information
- ▶ You may have several <footer> elements in one document

```
<!DOCTYPE html>
<html>
  <head>
    <title>Title of the document</title>
  </head>
  <body>
    <header>

      <!--HTML footer tag starts here-->

    <footer>
      <a href="https://www.geeksforgeeks.org/about/">
        About Us
      </a>|
      <a href="https://www.geeksforgeeks.org/privacy-policy/">
        Privacy Policy
      </a>|
      <a href="https://www.geeksforgeeks.org/careers/">
        Careers
      </a>

      <p>@geeksforgeeks, Some rights reserved</p>
    </footer>
```

[About Us](#) | [Privacy Policy](#) | [Careers](#)

@geeksforgeeks, Some rights reserved

<nav> Tag

- ▶ Used to contain the major navigational blocks on the site such as the primary site navigation.
- ▶ Websites typically have sections dedicated to navigational links, which enables user to navigate the site. These links can be placed inside a <nav> tag.
- ▶ Not all site links should be inside a <nav> element. The <nav> element is intended only for major block of navigation links.
- ▶ Screen readers for disabled users, can use <nav> element to determine whether to omit the initial rendering of this content.

[home](#) | [classes](#) | [catering](#) | [about](#) | [contact](#)

```
<!DOCTYPE html>
<html>
  <head>
    <title>Title of the document</title>
  </head>
  <body>
    <nav>
      <a href="/home/">home</a> |
      <a href="/classes/">classes</a> |
      <a href="/catering/">catering</a> |
      <a href="/about/">about</a> |
      <a href="/contact/">contact</a>
    </nav>
  </body>
</html>
```

<section> Tag

- ▶ Defines sections in a document, such as **chapters**, headers, footers, or any other sections of the document.
- ▶ The <section> element groups related content together, and typically each section would have its own heading.
- ▶ For example, on a homepage there may be several <section> elements to contain different sections of the page, such as **latest news, top products, and newsletter signup**.
- ▶ It may contain several distinct <article> elements that have a common theme or purpose.

</html>
```

<div> Tag

- ▶ Defines a division or a section in an HTML document.
- ▶ Often used as a container for other HTML elements to style them with CSS or to perform certain tasks with JavaScript .
- ▶ Where there is no suitable element to group a set of elements, the <div> element will still be used.

<hgroup> Tag

- ▶ Groups together a set of one or more <h1> through <h6> elements so that they are treated as one single heading.
- ▶ For example it could be used to contain both a title inside an <h2> element and a subtitle within an <h3> element.
- ▶ Some developers do not like the use of the <hgroup> element, and prefer to place a subtitle inside a <p> element.
- ▶ <hgroup> tag is popular with those developers who believe that it is useful to group together the primary heading and the subheading.

```
<!DOCTYPE html>
<html>
  <body>
    <hgroup>
      <h2>Japanese Vegetarian</h2>
      <h3>Five week course in Egypt</h3>
    </hgroup>
  </body>
</html>
```

Introduction to HTML5 SVG and Canvas

<svg> Element

- ▶ SVG is used to define various graphic object for the Webpages.
- ▶ Basic <svg> element syntax

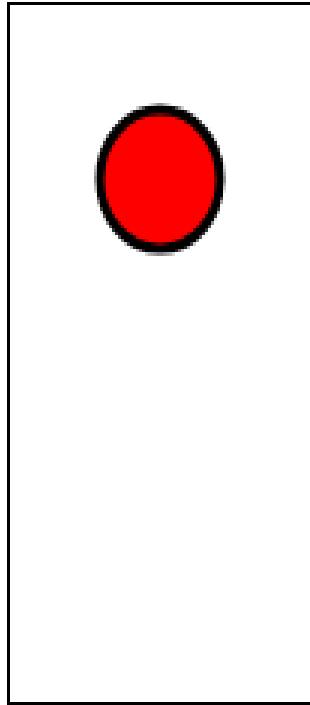

```
<svg width="100" height="200">  
  </svg>
```

- ▶ There are many HTML predefined shape elements that can be used inside SVG element like:
 - <circle>: Circle
 - <rect>: Rectangle
 - <ellipse>: Ellipse
 - <line>: Line
 - <polyline>: Polyline
 - <polygon>: Polygon

Drawing SVG Circle

- ▶ To draw a circle, the `<circle>` element is used
- ▶ The circle center x and y coordinates are defined using `cx` and `cy` attributes.
- ▶ The radius of the circle is defined using `r` attribute.
- ▶ If `cx` and `cy` values are zero, the default value will be `(0,0)`.
- ▶ **Stroke and Fill attributes** define the shape border and inner colors, `stroke-width` attribute defined the object stroke width value.

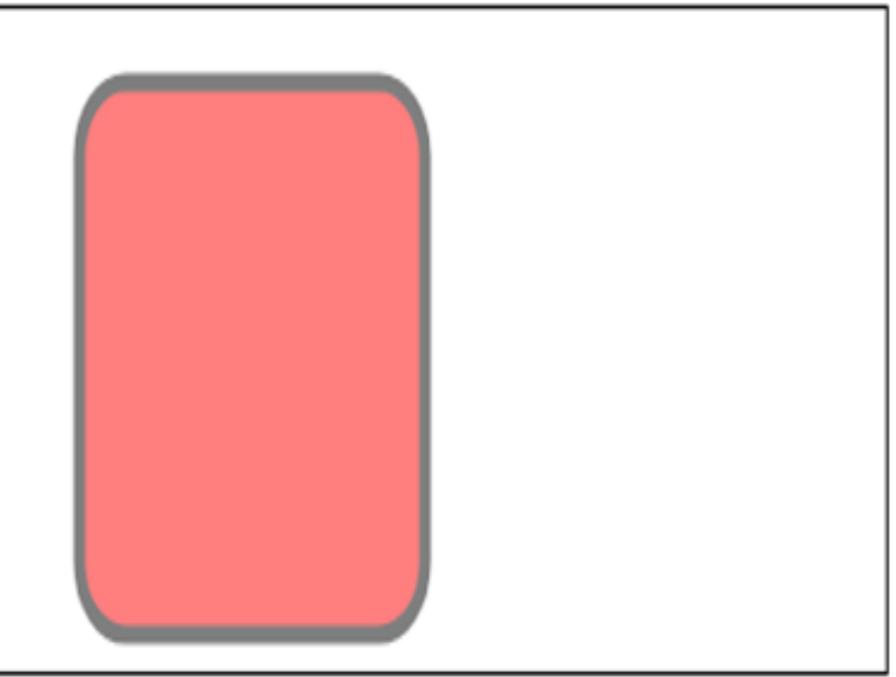

```
<!DOCTYPE html>
<html>
<head>
<title>
Cricle Element Example
</title>
</head>
<body>
<svg height="200" width="100" style="border:1px solid;">
<circle cx="50" cy="50" r="20" stroke="black" stroke-width="3" fill="red" />
</svg>
</body>
</body>
</html>
```

Drawing SVG Rectangle

- ▶ The <rect> element is used to draw a rectangle over SVG object.
- ▶ The rectangle left corner x and y coordinates are defined using x and y attributes.
- ▶ The height and the width of the rectangle shape are defined using **the width and height attributes** of the <rect> element.
- ▶ If x and y values are zero, the default value will be (0,0).
- ▶ **Stroke and Fill** attributes define the shape border and inner colors, stroke-width attribute defined the object stroke width value.
- ▶ **the opacity** of the fill color can be defined using **fill-opacity** property
- ▶ Also **the stroke-opacity** property is used to define the opacity of the **stroke color**.
- ▶ Rectangle rounded corners can be rounded with **rx** and **the ry** attributes.

```
<!DOCTYPE html>
<html>
<head>
<title>
Oricle Element Example
</title>
</head>
<body>
<svg width="400" height="180" style="border:1px solid;">
<rect x="50" y="20" rx="20" ry="20" width="150" height="150"
style="fill:red;stroke:black;stroke-width:5;opacity:0.5" />
</svg>
</body>
</body>
</html>
```

Drawing SVG Ellipse

- ▶ The <ellipse> element is used to draw an ellipse over SVG object.
- ▶ An ellipse object shape looks like a circle but in ellipse the **x radius (rx)** **attribute and y radius (ry) attribute** are different from each other while the circle radius is equal.
- ▶ The remaining ellipse HTML properties are the same as the circle element properties.

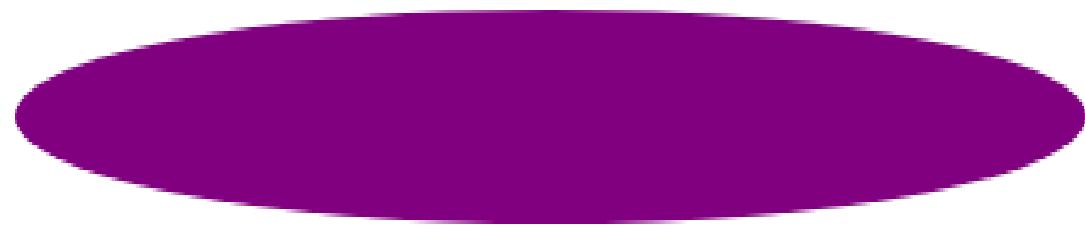

Attribute	Description
rx	Required. The x radius of the ellipse
ry	Required. The y radius of the ellipse
cx	The x-axis center of the ellipse. Default is 0
cy	The y-axis center of the ellipse. Default is 0

```
<!DOCTYPE html>
<html>
<head>
<title>
Cricle Element Example
</title>
</head>
<body>

<svg height="150" width="500">
<ellipse cx="240" cy="100" rx="220" ry="30" style="fill:purple" />

</svg>

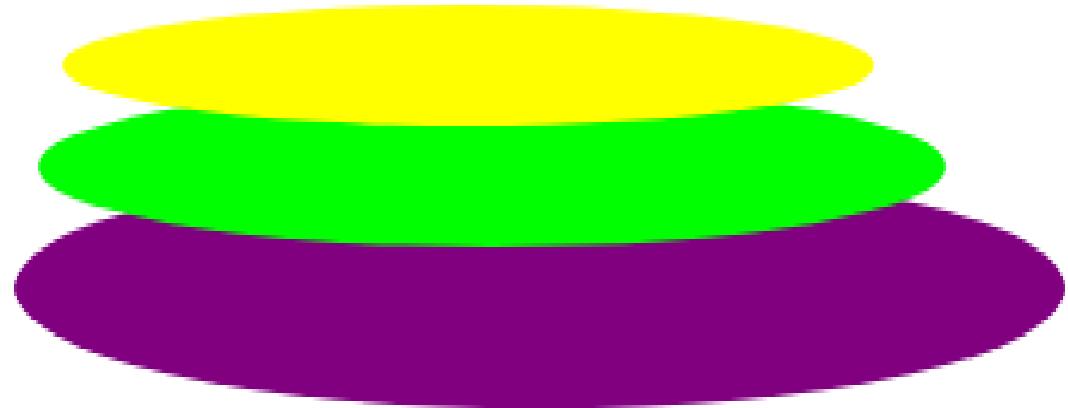

</body>
</body>
</html>
```

```
<!DOCTYPE html>
<html>
<head>
<title>
Cricle Element Example
</title>
</head>
<body>

<svg height="150" width="500">
<ellipse cx="240" cy="100" rx="220" ry="30" style="fill:purple" />
<ellipse cx="220" cy="70" rx="190" ry="20" style="fill:lime" />
<ellipse cx="210" cy="45" rx="170" ry="15" style="fill:yellow" />
</svg>

</body>
</body>
</html>
```

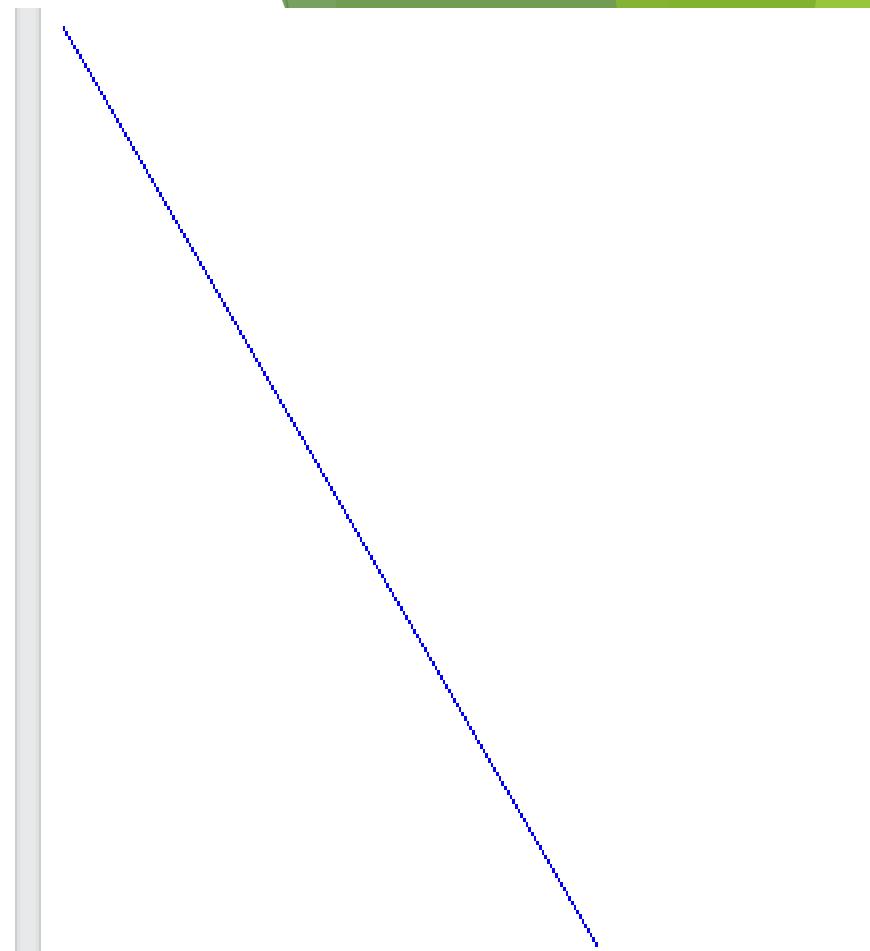

Drawing SVG Line

- ▶ The <line> element is used to draw a line over SVG object.
- ▶ The line start point is defined by x1,y1 attributes
- ▶ The line end point is defined by x2,y2 attributes
- ▶ Stroke and stroke-width attributes define the line color and the line thickness value.

```
<!DOCTYPE html>
<html>
<head>
<title>
Circle Element Example
</title>
</head>
<body>

<svg height="300" width="400">
<line x1="0" y1="0" x2="200" y2="200" style="stroke-width:3;stroke:blue"/>
</svg>
|
</body>
</body>
</html>
```

Thank you
